Abstract (en)

[origin: EP1152491A2] The arrangement has at least one contact with a first region for connecting to the conductor, a second region for other contacting and a two part housing for accommodating the contact. The first contact region has a base plate with at least one crown with serrations accommodated in openings in the second housing part forming a press part. Applying the second part to the first causes the serrations to penetrate the conductor and make contact. The arrangement has at least one contact with a first region for connecting to the conductor and a second region for other contacting and a housing with two parts (10,11) for accommodating the contact. The first region of the contact has a base plate with at least one serrated crown (23) with several serrations (24) accommodated in openings (35) in the second part of the housing forming a press part. Applying the second housing part to the first part causes the serrations to penetrate the foil conductor and make contact.
