Abstract (en)

[origin: WO0124704A1] An ultrasonic diagnostic imaging system is responsive to oral command for changing the state of the system or carrying out an instruction. In response to an oral command the system produces an audible response which assures a user that the oral command has been properly executed. Commands which may be carried out in this manner include those which change the operating state of the ultrasound system, measure and annotate images, produce diagnostic reports, control the signals which are used to form an ultrasound image, and control the quality of an ultrasound image.
