Abstract (en)

[origin: WO0142604A1] The invention relates to a sliding panel comprising several wall elements (12/1-12/n) that can be displaced laterally and are guided along a support profile (14) and in a sliding rail by means of rollers. At least one wall element (12/2) is configured as a door element which can be actuated by means of a door closer (30). An automatically coupling or decoupling rod assembly consisting of sliding rails is arranged between the door closer (30) and the wall element (12/2) that serves as door element. The door element is automatically held in the position of displacement thereof when the sliding panel is displaced.
