Abstract (en)

[origin: EP1153833A1] The extruded material is divided by cross perforations into individual sections which are separated off by relative movement between the tongs (4) which grip the long sides of the section and the continuously rotating wheel (1) on which the tongs are mounted at the side. The tongs can swivel in the circumferential direction of the wheel and can be accelerated to produce the relative movement. The tongs have an upper and lower jaw (6, 7).
