Abstract (en)
[origin: WO0049987A1] This single or double sauna cabin has the peculiarity of adopting a thermostat which regulates the mixing of cold water from the domestic water system with hot water from the traditional supply system of sanitary fittings at a preset safety temperature of about 55 DEG C. This thermostat serves a two-way cock with sequential selection and manual control in order to spray thermostated hot water, first, to two nozzle sets simultaneously, during a preparatory heating phase of the empty cabin, and then to one set only aiming at maintaining the temperature degree and steam content previously set.
