Abstract (en)

[origin: WO0049250A1] A locking device for interlocking two members with an adjustable distance therebetween. There is provided a male lock member (24) having a spindle (26) formed with a friction surface (28a), and a female lock member (10) with cavity (16) into which the spindle (26) is insertable. Over the cavity (16) a spring urged reciprocable prismatic member (18) with a counter friction surface (18a) is installed, so that the two friction surfaces (28a, 18a) are in overlapping contact. A standard key-operated locking device (22, 222) is used to hold the friction surface of the female member (10) tightly against the friction surface of the male member (24), thus attaining the locked position of the device. The device is particularly useful for slide doors and windows.
