Abstract (en)

[origin: EP1155716A1] The fixation (5) is mounted on an curved element, which has one end fixed on the board by the pins (33) and the other end hinged (26) to the same board. In the cavity formed under the element (22), there is an absorbing material (21), which absorbs some movements. The efforts applied by the user are transmitted via the shoe fixation to the element (22) which then transmit it almost entirely to the ski board at the point of fixation (33). The effort is applied in front of the fixation.
