Abstract (en)
[origin: EP1155999A2] The device has a sheet feeder and a non-stop device with bearer rods for temporarily carrying a residual stack while the stack is being processed by a separating device. A control arrangement monitors rod insertion and/or retraction movements. The rods have a common sensing arrangement that they contact at least when inserted. At least one sensor detects the position of the sensing arrangement relative to the non-stop device. The device has a sheet feeder and a non-stop device with bearer rods (7) for temporarily carrying a residual stack while the residual stack is being continuously processed by a separating device. The bearer rods can be moved into the stack area of the sheet feeder and out again by one or more drives for stack changing in the non-stop device and are held in guide arrangements. A control arrangement monitors the insertion and/or retraction movements of the rods. The rods are driven individually and have a common sensing arrangement that they contact at least in the inserted position. At least one sensor detects the position of the sensing arrangement relative to the non-stop device.
