Abstract (en)
[origin: WO0047089A1] Device for mounting panel-shaped objects on the uprights of a stand or the like. The panel (3) is provided with at least one row of projecting hook-shaped mounting devices (4, 6) and the uprights of the stand are provided with a row of openings (5) to take the hooks. In order to prevent an accidental release of the panel (3) at least one of the hooks (6) is arranged to make more shallow contact with the wall of the upright than the other hooks (4), and a device (7) is arranged which limits the raising of a mounted panel (3) to a position in which only the hook (6) which makes the most shallow contact is no longer in contact with the wall of the upright below the corresponding opening (5). In this position that part of the panel where the abovementioned hook (6) is arranged can be bent outwards, so that this hook is released from the opening (5) and the panel (3) can be raised higher in order to be released completely from the upright.
