Abstract (en)

[origin: WO0015399A1] There is provided in association with a wood working tool having a cutting blade (40), a carrier (10) which can receive wood and guide means (21) associated with the carrier to cause it to move past the blade on a predetermined path (13), whereby timber (14) carried by the carrier can be cut reproducibly to size. The carrier may have a groove or the like which corresponds to the shape to be cut which is received by the guide means and on movement of the carrier, the interaction between the groove and the guide means causes the carrier to follow the required path. The tool can have means whereby a number of similar articles can be cut from a single piece of material and the cutting of similar pieces can be effected automatically.
