Abstract (en)

[origin: EP1035738A1] The invention relates to a method for operating a telecommunications network. A network element (16) situated on a node of the telecommunications network is controlled by a control computer (36). Said control computer (36) is controlled by an operator computer (24). Allomorphy is taken into consideration in the improvement of application programs (102, 104) so that even a non-improved operator computer (24) is able to control the control computer (36). Making allowance for allomorphy results in little additional complexity since an interface program (100) is provided for in which essential processing steps are executed for all application programs (102, 104) and thus ensure that allomorphy is taken into consideration.
