Abstract (en)

[origin: DE19909435A1] The invention relates to a method for the production of brushware articles consisting of a bristle support and bristles of at least two different types which are gathered into at least one group having a defined cross section and fixed to the support. According to said method the bristles of a particular type are gathered into a partial group and the partial groups forming a whole bristle group are gathered to form a bristle group which is then fixed to the bristle support. In a guide of a shaping device the cross section of the bristles of each partial group is deformed such that this cross section corresponds to their partial cross section in the bristle group. While ensuring that the partial groups retain their partial cross sections, said partial groups are then gathered in the guides such that the cross section of the bristle group is obtained. The invention also relates to a device for carrying the above method and to brushware obtained with same.
