Abstract (en)
[origin: WO0055059A1] The invention relates to a pouring device for a canister-type container (1), comprising a pouring neck (4) which can be closed with a sealing cap (6) and which liquid-tightly accommodates a retaining ring (7) for a ventilation pipe (8). Said ventilation pipe is at least approximately axially parallel to the retaining ring (7) and is joined to the retaining ring (7) at least in the upper peripheral section thereof in relation to the pouring-out position. According to the invention, the ventilation pipe (8) is sealed at the end (9) facing away from retaining ring (7) and has at least one through opening (10) in the area of what is the upper peripheral section in the pouring-out position in order to create advantageous pouring-out conditions, said through opening opening into the container (1) and having a smaller opening cross-section than the inner cross-section of the pipe.
