Abstract (en)

[origin: WO0047845A1] Device at fence systems, comprising wire netting (1), moulding strips (2) having at least one longitudinally extending track (3) and fittings (9) for connecting wire netting and moulding strips. The tracks (3) of the moulding strips have an opening (4) which is restricted by two longitudinally extending wall parts (5, 6) inside which the track expands. The wire netting (1) has an outer edge part along which, at least partly, the outermost edge is a edge wire (8). This at a joining to a moulding strip (2) is introduced through an opening (4) of the track (3) and is moved to the side inside a first (5) of said wall parts (5, 6). The fittings (9) have a locking part (10) and a gripping part (11), that the locking part (10) projects from the gripping part (11) and is designed in such a way that it can be introduced through the opening (4) of the moulding strip in at least two opposite turning positions. The locking part (10) at its free end has a hook (14) or the like projecting in one direction, which hook is arranged to extend in the longitudinal direction of the opening in said turning positions. Said hook (14) is arranged to, in at least one of said locking positions at the turning of the gripping part (11) into one locking direction, enter into locking engagement underneath the second wall part (6), whereby the locking part (10) fix the edge wire (8) inside the first wall part (5). The fitting (9) can, at dismantling of the fence, be brought out off locking position by a simple turning movement.
