Abstract (en)

[origin: WO0053947A1] The invention relates to a clutch with a clutch controller (7) that can be linked with a gearbox via a gearbox-mounted contact surface (31), and a pressure plate (1) that pushes, in an engaged position, a driving disk (2) against a counter surface (3). For disengaging the clutch, said driving disk is moved by the clutch controller (7) into a disengaged position in which the pressure plate (1) does not push the driving disk (2) against the counter surface (3). Said clutch controller (7) comprises a pull mechanism (87) that pulls the pressure plate (1) from the engaged position to the disengaged position when the clutch is disengaged. The gearbox-mounted contact surface (31) is configured as a junction between the clutch controller and the gearbox at which the clutch controller can be released from the gearbox in the mounted state.
