Abstract (en)

[origin: EP1160182A1] The present invention relates to a process used to sort out a lot of items loaded in bulk on a conveyor system according to a predefined order. This process is basically characterised by the fact that it includes two different phases to separate the items thanks to the presence on the conveyor system of two groups of exits; it being provided, in particular, that the first separation phase carried out with the first group of exits is preliminary to the second and final separation phase carried out with the second group of exits, that is the phase that allows to sort out the items according to the predefined order.
