Abstract (en)
[origin: EP1160341A2] Process for hardening rails or a rail head comprises: leveling the rails in the austenitic state; and horizontally positioning and clamping to prevent bending. While maintaining the clamping position, the rails and/or a part of the rail cross-section are partially cooled from a temperature which lies above the Ac3 point of the alloy converting the structure from an austenitic structure to a room temperature stable microstructure. An Independent claim is also included for a device for hardening rails or a rail head comprising a rail supporting device formed as a support (2) with a longitudinal extension corresponding to the rail with positioning elements (3) and detachable clamps (4) for holding the rail.
