Abstract (en)  
[origin: EP1160814A2] The device has an elastic switching mat (4) on a circuit board (1) with at least one hat-shaped switching region (5) raised from the board with an electrically conducting switching bridge (8) on the inner end surface (7) that can be into contact with the conducting track under pressure on the switching region. The switching bridge is formed by a metal plate held by the inner end surface.
