Abstract (en)

[origin: EP1162428A2] Actuating variables detected during the flight of a guided missile predict place of hit (28). Ignition delay time for a proximity fuse is adjusted according to the predicted place of hit and by devices for performing these procedural stages. Processing images in a homing head view finder estimates time-to-go. Connected to an ignition device section with delay tables, signals on first (30) and second (32) outputs measure a direct hit or near miss respectively.
