Abstract (en)  
[origin: WO0138127A1] The present invention relates to a floor for a vehicle constructed from a plurality of inter-engaged elongate members (Items 11 and 12) (figure 1) supported upon the original load area of the vehicle. The elongate members may have semi-circular male and female connections (Items 15 and 16) (figure 1) along either side, and may have an anchorage recess (Item 21) (figure 1) running along their length. The recess has means to prevent an anchorage member (Item 24) (figure 2) from being vertically removed, where the anchorage member may be used to anchor a seat or wheel chair support structure in place in two such recesses (figures 3 and 4). The anchorage members are attached to the base or the seat or wheel chair support by means of an adjustable tightening mechanism, thus operating to draw the anchorage block towards the base. The anchorage member may have a T-form or L-form, and the wheel chair support may have a ratcheted strap retaining mechanism.
