Abstract (en)
[origin: EP1163863A1] The carousel device is for a kitchen corner cabinet and has a holding column (7) rotatable around a vertical rotary axis (8) for retention of at least one compartment base (4), which has a cut-out (18), so that it can be fitted from the side to the holding column. A door (5,6), particularly twin-paneled, is fitted to a cabinet aperture running over the corner. The door is movable between an outer closed position and an open position facing the holding column, inserting in the compartment base cut-out in the open position. The holding column is eccentric in relation to the rotary axis and is thereby displaced in relation to the door side of the carousel device.
