Abstract (en)  
It is an object of the reinforcing holder against vibrations according to the present invention to be mounted on a joining part of architectural structural member such as foundations, columns, beams, and cross-beams or the like to reinforce them so that a wooden building is not broken down, even if strong vibrations are loaded thereupon by an earthquake, a typhoon or the like. The reinforcing holder against vibrations is for joining architectural structural members A and A disposed orthogonally, comprising a first reinforcing base member 1 which is formed of a plate of high tension steel bent by 90 DEG and secured to one architectural structural member A, and a second reinforcing base member 2 which is arranged symmetrically with the first reinforcing base member 1 through a hinge 4 and secured to another architectural structural member A, characterized in that the second reinforcing base member is so designed that the plate of high tension steel is bent by 90 DEG and absorbing members 3 having rubber elasticity are mounted at a plurality of locations thereof, being secured to another architectural structural member A with the absorbing members 3 interposed, and another architectural structural member A is joined to one architectural structural member A. <IMAGE>
