Abstract (en)

[origin: EP1166669A1] The snowboard boot comprises a sole assembly including a walking sole (1), whose lower front surface (4) comes into contact with the ground, and a reinforcing piece. There is a component (10) in an elastic material interposed between a transverse spindle (5), whose ends engage fixing jaws, and the sole assembly. This element is able to deform to allow a lateral displacement of the boot relative to the fixing.
