Abstract (en)

[origin: EP1167625A2] The rail track support structure, for a permanent way along a lengthy bridge, has a compensating plate (6) at the expansion joints with limit stops (7) which restrict its sliding movement along the line of the rail track. The limit stops have at least one barrier block, which maintains a minimum and maximum gap between the compensating plate and a neighboring plate for the bridge track path (12) at a bridge track section or the abutment (13). Side mountings prevent the compensating plate sliding across the rails.
