Abstract (en)

[origin: DE19916579A1] The invention relates to a pneumatic brake booster (10) comprising a control valve (22) for controlling a pneumatic pressure differential, a force input member (24) for actuating the control valve (22), a force output member (38) for transmitting the brake force, a reaction disk (34) made of an elastomer material which is positioned between the force output member (38) and the force input member (24), and a device which is arranged between the reaction disk (34) and force input member (24) and acts on said reaction disk (34) such that the force transmission ratio between the force input member (24) and force output member (38) is modified in accordance with the force to which the force input member (24) is subjected. To obtain a device of this kind which is more economical and easier to mount, the device is configured as a unit taking the form of a cartridge (30) which can be preassembled and inserted into the control valve (22) after preassembly.
