Abstract (en)
[origin: EP1170433A1] Concrete palisade comprises vertical walls which have the cross-section of an equal-sided trapezium. Each trapezium side has tongues (1) and grooves (2) in accordance with rotation symmetry, which form a group which does not occupy the complete length of the trapezium side and lies in the middle. Preferred Features: The depth of at least one outer tongue of a group is less than the depth of the other tongues, and/or the depth of one of the outer grooves of a group is greater than the depth of the other grooves. The section having no tongues or grooves does not reach the central joint line of adjacent concrete palisades but lies parallel to it.
