Abstract (en)
A clip (2) for attachment of a segment of expanded metal mesh to a support post consists of a plate (4) having four inwardly directed flanges (6, 8, 10, 12) which are configured to hold captive the sides of the segment so as to confine the segment against horizontal or vertical movement. The clip is provided with a series of spaced apertures (20) or a single slot-like aperture (22) to permit fastening of the clip to the post even when the mesh segment is offset laterally from the post. The apertures (20, 22) are arranged asymmetrically within the clip to accommodate a lateral offset of the mesh to either side of the post by inversion of the clip.
