Abstract (en)
[origin: WO0158394A1] The invention relates to a condom provided for sliding over an erect penis and consisting of a tubular sheath (2). Said tubular sheath is made of a thin-walled flexible natural resinous material or synthetic material, is closed at the tip of the penis, and is provided with a bead (5) at the opposite end. An electrically conductive metal foil (7) that can be subjected to a current voltage is provided in the area (3) of the tubular sheath (2) that accommodates the glans of the penis. This results in considerably increasing the erectility and the erection duration of the man's penis as well as considerably increasing the mutual feeling of pleasure of the man and woman by directly supplying the stimulating current to the glans of the penis.
