Abstract (en)
[origin: WO0062926A1] Beta-silicon carbide particles impregnated with a vanadyl pyrophosphate oxidation catalyst are prepared by forming a heterogeneous reaction mixture of suspended vanadium (IV) phosphate (via hydrochloric acid digestion of V₂O₅ and H₃PO₄ in an aqueous solvent or via heating vanadium pentoxide with at least one substantially anhydrous unsubstituted alcohol having 1-10 carbon atoms, 1-3 hydroxyl groups and free from olefinic double bonds to form a feed of vanadium pentoxide reduced to a valence between 4 and 4.6, and then contacting the feed with a solution of orthophosphoric acid and at least one unsubstituted alcohol as described above), adding particulate beta-silicon carbide to the heterogeneous reaction mixture under agitation at moderated temperature between 40 DEG C and 120 DEG C, followed by drying, washing and calcining the particles thus formed.
