Abstract (en)

[origin: DE19918169A1] The downward movement of the pressure foot (16) by the needle bar (17) through a spring (F) is limited by an interceptor (10) to control the pressure on the fabric (18). The position of the interceptor (10) is adjustable relative to the needle plate (19), e.g. by mounting the pivot (10a) eccentrically on a rotating adjuster (7). Adjustment can be automatic using a sensor to determine fabric thickness.
