Abstract (en)

[origin: WO0061898A1] The invention relates to a control device for at least one electric motor device, especially a garage door opener, that is used to actuate or set into operation a garage door drive. Said control device comprises essentially a transmitter device (6) for transmitting electromagnetic signals and at least one manual actuator (4). The transmitter device (6) can be arranged in flexible mounting areas inside or outside the motor vehicle and can be spatially separate from the manual actuator (4) to a large extent. To this end, the invention provides a garage door opener (1) that is integrated into the control system that is present in a motor vehicle in such a manner that the manual actuator (4) and the transmitter device (6) are linked with each other via at least one control device (2, 3) that is located in the motor vehicle.
