Abstract (en)

[origin: DE10003819C1] The operating process involves the use of a sensor providing an ionization signal. At a first point in time, this signal reports the nominal load and partial load of the burner, producing a first difference. At a second point in time, it reports these values again, producing a second difference. The two differences are compared with each other, as a result of which the burner will be closed down if necessary.
