Abstract (en)

[origin: EP1176369A1] The feed system, comprising a heat or cold generator (1) and a distribution interface, has a common feed coupling for two or more circuits, while the interface is in the form of a manifold assembly (17) with at least two distributors. The assembly has an upstream distributor (23) and a downstream distributor (24) mounted in series in the generator's primary load circuit and separated by a circulating pump (25). The chambers of the upstream distributor are connected by a controlled variable flow unit (43), while those in the downstream distributor are connected by a passage (50).
