Abstract (en)
[origin: EP1176404A1] In a combination weighing system, a connection is established by Internet between a combination weighing apparatus comprising a weighing machine control portion for setting an operating condition of a weighing machine and logging an operating state of the weighing machine; and a network connecting device for receiving setting information of the operating condition and transmitting log information of the operating state, and a server computer that includes a network connecting device and manages the setting information of the operating condition and the log information of the operating state. With this combination weighing system, it is possible to set the operating condition of the combination weighing apparatus without a need for a person in charge to go to a place where the combination weighing apparatus is installed and to stop an operation of the combination weighing apparatus. <IMAGE>
