Abstract (en)
[origin: WO0056189A1] A support bracket (10) including a body (11), a bracket assembly associated with one side thereof and pivotally moveable about pivot pin (30) from a position where it is spaced from the body (11) to one where it is received in a recess (20) in the body, the bracket assembly having a portion (41) which is pivotally connected to the body by pivot pins (30) and a pair of arm members (46, 47, 48), at least one of which is pivotally connected to the portion (41), the pivotal connection (49) of the arm member (46, 47, 48) having its axis (49) substantially at right angles to the pivotal connection (30) of the bracket assembly to the body, the arm member(s) being able to adopt a position where they extend outwardly from the body (11) of the bracket when the bracket assembly is rotated out of the recess via pivot pins (30) but when the bracket assembly enters the recess (20), the arm member(s) are constrained to move inwardly by the sides of the recess and if they are extending about a member, e.g. a post (55), at the time, they can take a position where the support bracket is held relative to the member (55). The bracket is useful to enable easy and infinitely variable location of a support bracket for a movable shelf or tray on a post without extra tools.
