Abstract (en)

[origin: EP1178496A1] Molding a core (N) of an electrical isolator includes forming the core with equally spaced radial grooves (R). The spacing equals the thickness of the core. The grooves extend along the core from the upper end of the core. The core fits into a dielectric envelope with throat(s) (C) for receiving a conductor. The envelope may be made of the same material as the core and molded over it. Alternatively it is made of a different material and glued to the core. The core is assembled from several identical pieces.
