Abstract (en)  
[origin: EP1178575A1] In a connector (5) in which an insulator (41) holds a first and a second conductive contacts (21,31) adapted to be brought into contact with and released from each other, the first conductive contact has a main spring portion (22) or a seesaw portion supported by the insulator to be movable in a seesaw movement in a predetermined direction. An operating portion or a contacting portion (26) is formed at one end of the main spring portion to be operated by a mating contact (53) in the predetermined direction. A contact point (28) is formed at the other end of the main spring portion and faced to the second conductive contact in the predetermined direction. <IMAGE>
