Abstract (en)

[origin: FR2793691A1] Using antibodies, or their fragments or analogs that recognize sub-units alpha , beta , and psi of interleukin (IL)-2 receptors, in medicines for the prevention and treatment of mammalian immunodeficiency virus (IV), especially human (H)IV, simian (S)IV, and feline (F)IV, is new. Using antibodies, or their fragments or analogs that recognize sub-units alpha , beta , and psi of interleukin (IL)-2 receptors, in medicines for the prevention and treatment of mammalian immunodeficiency virus (IV), especially human (H)IV, simian (S)IV, and feline (F)IV, is new. The antibodies prevent fixation of the virus on target cells by steric hindrance. The antibody analogs are peptides which mimic antibody paratopes or which are capable of fixing themselves to the defined IL-2 subunits.
