Abstract (en)
[origin: DE10033616A1] The system has a number of different objects and holding devices on a transport device and fed to a succession of spray pre-treatment devices with treatment medium collection basins immediately adjacent to each other and a separating device near the edges of adjacent basins that can be moved to free the transport path. A spray nozzle arrangement integrated into the separating elements can be removed and lowered with the separating elements. The system has a number of different objects (7) and holding devices (6) arranged on a transport device and fed to a succession of spray pre-treatment devices with collection basins (1) for the treatment medium arranged immediately adjacent to each other and a separating device (15) near the edges of adjacent basins that can be moved away to free the transport path. A spray nozzle arrangement is integrated into the separating elements and can be removed and lowered with the separating elements.
