Abstract (en)  
[origin: WO0071831A1] The invention relates to a hollow-core slab bearer for bearing an end of a hollow-core slab which borders on an opening. The bearer comprises: a profile (1) with an L-shaped cross-section, the profile having a first and a second end (2, 3), and the hollow-core slab end which borders on the opening being placeable into the profile (1) with an L-shaped cross-section; a first end portion (4) at the first end (2) of the profile (1) with an L-shaped cross-section; and a second end portion (5) at the second end (3) of the profile (1) with an L-shaped cross-section. The hollow-core slab bearer further comprises a first support member (6) which allows the hollow-core slab bearer to be mounted onto a first hollow-core slab or structure adjacent to the hollow-core slab which borders on the opening, and a second support member (7) which allows the hollow-core slab to be mounted to a second hollow-core slab or structure adjacent to the hollow-core slab which borders on the opening. Between the first and the second end portion (4, 5) is arranged a reinforcement (8) which binds the first end portion (4) and the second end portion (5) together.
