Abstract (en)

[origin: WO0065809A1] The present invention provides a system architecture, adapted to facilitate the provision of services to mobile telephone subscribers, which simplifies the introduction of new services. This system architecture permits subscribers to control the personalisation of the services which they use. Furthermore, since the system architecture permits a subscriber to modify the personalisation of services using a PC operating over, for example, the Internet, this architecture reduces the use of radio resource. The telecommunications system includes a telecommunications operator's server, a plurality of mobile transceivers, at least one service provider's server, data storage means and a plurality of subscriber's PCs. Each of said plurality of PCs is adapted to communicate with said operator server, as are the service provider's server and the mobile transceivers. The storage means contains a service data base and a database of services personalised by subscribers and is adapted to communicate with said operator's server. The subscriber's PCs may communicate with the operator's server over the Internet.
