Abstract (en)

[origin: EP1180575A2] Between the door-frame (8) and the door jamb (5) is a spring element (4) which is twisted when the front door-attachment (1) is opened and which automatically closes when the door is left, as a result of the energy accumulated in the spring element. The spring element is in the form of a torque rod with a first end section joined to the frame of the attached-door, and a second end section joined to the door-jamb. At least the fitting (2) on the attached-door slides along the vertical frame profile (8) and is detachably fixable.
