Abstract (en)

[origin: EP1050855A1] The device detects a magnetic identification for a test object (3) transported along a transport path (2) using a number of magnetic field sensors extending across the full width (B) of the transport path, combined with at least one magnetization device (10,11), also extending across the full width of the transport path, in a common module (1). An Independent claim for an automatic banknote checking device is also included.
