Abstract (en)

[origin: WO0074035A1] The invention relates to a method and arrangement (1) for transmitting data signals containing individual characteristics, in particular speech signals. Said method and arrangement comprise a transmitter (3) and a receiver (5). The transmitter has compartmentation elements (15 to 27) for separating the individual characteristics from the data signals, in addition to elements for separately transmitting both the data signals which have been stripped from the individual characteristics and have been normed and compressed and the individualisation data, using separate logical channels (CH1, CH2).
