Abstract (en)
[origin: WO0074280A1] An apparatus comprises a data analog channel (212) having a wire connector (201), a data channel and a transformer where the transformer couples the wire connector to a bandpass filter within the data channel. A method comprises channeling voice (211) and data (212) to a first transformer (204) and a second transformer (204), extracting the voice signals by filtering the data signals through the first transformer (204), and extracting the data signals by filtering the voice signals through the second transformer (204).
