Abstract (en)  
[origin: EP1182019A1] The device has a motor in a housing driving a hollow spindle and a fast clamp. A clamping lever has a slide element that can be brought into contact with a clamp spindle end remote from the tool by rotating the lever. The clamp spindle has a contact surface whose dimension in the pivoting direction is at least the product of the sine of the slide element deflection angle and its radial distance from the rotation axis. The device has a motor in a housing driving a hollow spindle (2) and a fast clamp for holding a tool with a clamp spindle (4) coaxially movable in the hollow spindle and a clamp lever (6) movable between tool clamping and replacement positions. The clamping lever has a slide element (8) that can be brought into contact with the clamp spindle end remote from the tool by rotating the lever. The clamp spindle has a contact surface (11) whose dimension (K) in the pivoting direction is at least the product of the sine of the slide element deflection angle (alpha) and its radial distance (a) from the rotation axis (9)..
