Abstract (en)

[origin: EP1182247A1] Production of high octane base petrol by hydroisomerization of 5 - 8C charge comprises sections of hydroisomerization and separation by adsorption. Separation section contains adsorbent with two types of channels, main channels having ring opening defined by at least 10 oxygen atoms (10MR) and secondary channels of at least 12 oxygen atoms(12MR), secondary channels being accessible to charge only by main channels.
