Abstract (en)

Within electronic devices in many cases there exists a need for a manual individual actuation of several switching elements for performing an adjustment of different parameters by a single switch, especially for a pleasure appearance of a front panel and for saving place on the panel. It is an object to provide a switch for this purpose ensuring among others low costs, small size, high reliability, convenient actuation and having good properties for being mounted on a printed circuit board. The actuation means for several switching elements (16) includes an actuating plate (6) being pivotably mounted in a housing (1) on two perpendicular axes and a push-button (21) located within a central opening (8) of said plate (6). <IMAGE>
