Abstract (en)
[origin: WO0152765A1] The present invention relates to a newly invented dental implant system to provide an implant and an abutment fixed on having an excellent fixing ability against the outer force, and contains: an implant inserted into dental alveolar bone and, an abutment combined with the above implant and sustains artificial tooth on it; and comprises a post elongated from the above implant and connected with a socket of the body of the above abutment, and anchoring part provided on the surface of the above body of the abutment to anchor with the dental alveolar ridge bone. The post of implant is formed with the implant as a unit and can be made as a separated member with the implant, connects the implant and the abutment. The implant is possibly laid vertically and horizontally and this provides three dimensional dental implant system relative to the dental alveolar bone according to this invention. With the above technique according to this invention, implant system can be adopted to alveolar ridge bone even if the height and size are not enough to operate.
