Abstract (en)
[origin: WO0075462A1] The invention relates to a block forming a dead form work element for the construction of a mechanically resistant concrete wall. The block essentially comprises two parts (1a,1b) which can be assembled, each part consisting of a main surface (10a,10b) which is integral with and acts as the starting point on one side for bracing elements in the form of a shaft (11a,12a,13a,14a,14b), whereby said parts when assembled rest against each other and interlock via the ends of the bracing elements. The invention can be used to improve the construction of swimming pools.
